

Checking the intonation

We chose an equal temperament temperate to adjust our musical instruments because the predominant harmonic on an electric guitar is in the ear of the author octave.

Here is the procedure to check the intonation of the instrument:

a / clean all the strings before verification because there is a deposit of condensation which provides the weight of a portion of the string and thus changes the intonation of the string;

b / tune his instrument using the second harmonic of the open string;

c / measured using a tuner or frequency deviation in cents harmonic 2 of the open string, it must be identical to the frequency deviation in cents or obtained when pressing the string at the 12th fret.

Repeat the procedure for each string and make setting the intonation if necessary, preferably after changing strings.

We recommend that you use Intonation Tool Software for setting intonation and follow the setup procedure provided.
